
CLI Agent RELEASE NOTES v0.1.1-hygiene

C-Governed CLI Agent Mesh draft protocol pack

Kotov Ivan
Bruxelles, 2026

Status	Draft protocol pack / v0.1.1 hygiene-synchronized / not implementation-executed / not conformance-supported / not public-release-ready without applied release gate
Layer	c = a + b / SER / L4 / Agent Governance / CLI Worker Mesh / Defensive Adaptation / Witness
Document class	release notes / package summary / release-boundary artifact
Assertion class	C-A10 package-control artifact

Release: C-Governed CLI Agent Mesh v0.1 / v0.1.1 hygiene synchronization

Release notes date: 2026-05-17

Original package build date: 2026-05-16

Status: Draft protocol pack / v0.1.1 hygiene-synchronized / not implementation-executed / not conformance-supported / not public-release-ready without applied release gate

Layer: `c = a + b` / SER / L4 / Agent Governance / CLI Worker Mesh / Defensive Adaptation / Witness

Document class: release notes / package summary / release-boundary artifact

Assertion class: C-A10 package-control artifact

Primary package index: CLI_Agent_Package_Index_and_Reading_Order_v0_1.md

Primary contradiction register: CLI_Agent_Contradiction_Register_v0_1.md

Primary open-issues register: CLI_Agent_OPEN_ISSUES_v0_1.md

0. Release summary

This release introduces and synchronizes **C-Governed CLI Agent Mesh v0.1**, a draft protocol pack for using local, cloud, hybrid, and portable CLI agents as bounded executable workers under persistent `c` governance.

v0.1.1 is a hygiene synchronization layer. It does not change the root doctrine. It closes missing-document gaps, normalizes status claims, and prepares the package for controlled schema extraction and local checking.

Core claim:

A persistent `c` may use many executable agents, but no executable agent may silently become `c` authority.

Compact formula:

```
Many executable hands.  
One governed continuity.  
No silent autonomy.
```

1. Main contribution

The package defines a governance stack for executable agents operating under `c`:

```
agent discovery  
-> registry eligibility  
-> handshake/admission
```

```
-> task contract
-> scoped permission
-> AB/gate evaluation
-> sandbox/worktree execution
-> witness
-> local checker
-> review/quorum
-> memory gate / release gate
-> rollback/freeze if needed
-> conformance tests
```

It allows agents to:

```
inspect
propose
simulate
patch
test
compare
report
```

It does not allow agents to become:

```
will
memory
sovereignty
judge
release authority
incident authority
retaliatory operator
```

2. v0.1.1 hygiene changes

The following companion documents are now part of the synchronized package-control set:

```
CLI_Agent_Release_and_Implementation_Readiness_Gate_v0_1.md
CLI_Agent_Raw_Evidence_Sidecar_Profile_v0_1.md
CLI_Agent_AB_Mode_and_Gate_Semantics_Profile_v0_1.md
CLI_Agent_Registry_Profile_v0_1.md
CLI_Agent_Local_Checker_Profile_v0_1.md
CLI_Agent_Release_Public_Surface_Profile_v0_1.md
CLI_Agent_Schema_Object_Registry_v0_1.md
CLI_Agent_Semantic_Validator_Rules_v0_1.md
CLI_Agent_v0_1_1_Hygiene_Patch_Notes.md
CLI_Agent_Package_Index_and_Reading_Order_v0_1.md
```

Key corrections:

```
SCDP source status: source_available
CTM source status: source_available
Package Index status: source_available / recreated
Raw evidence exception: centralized through Raw Evidence Sidecar
A/B semantics: B alone grants no authority
Registry: eligibility record, not permission
Local checker: deterministic preflight, not judge
```

Schema validity: necessary but not sufficient
Semantic validators: required for safety boundaries

3. Included documents

File	Role	Status
README.md	Human entry point, status boundary, safe reading path.	canonical draft / v0.1.1 package set
C-Gov- erned_CLI_Agent_Mesh_Protocol_v0_1 .md	Root protocol and doctrine.	canonical draft / v0.1.1 package set

4. Current contradiction status

The synchronized contradiction register records:

```
Hard contradictions found: 0
Architecture-level doctrine: coherent
v0.1.1 hygiene patch: applied at package-control document level
Remaining release blockers: 5
Remaining implementation-readiness blockers: 6
Conformance-supported claim: not allowed
```

Interpretation:

- The package is structurally coherent at draft level.
 - No current document requires a load-bearing behavior that another current document forbids.
 - The package is **not** yet release-complete.
 - The package is **not** yet implementation-executed.
 - The package is **not** yet conformance-supported.
-

5. Release boundary

5.1 What this release is

This release is:

- a draft protocol pack;
- a governance model for executable CLI/cloud agents;
- a defensive boundary architecture;
- a schema-oriented design layer;
- a conformance-test basis;
- a v0.1.1 hygiene-synchronized package-control set;
- a package prepared for controlled schema extraction and local validation.

5.2 What this release is not

This release is not:

- legal advice;
- product certification;
- cyber authorization;
- deployment-ready implementation;
- offensive security manual;
- proof that CLI-agent meshes are safe in all contexts;
- a universal law for AI agents;
- a substitute for human, legal, security, or jurisdictional review;
- a conformance-supported artifact.

5.3 Public-release warning

The following files are sensitive and should not be released publicly without applied redaction review:

```
CLI_Agent_Defensive_Emulation_Boundaries_v0_1.md
CLI_Agent_Incident_Response_Profile_v0_1.md
CLI_Agent_Secrets_and_Cloud_Data_Policy_v0_1.md
real evidence packets
real raw evidence sidecars
real cloud exposure records
real provider boundary records
real incident reports
```

6. Red-line boundary

Across the whole package, the following remain prohibited:

```
hack-back
live external counter-operation
malware behavior
credential theft
covert persistence
evasion
unauthorized scanning
unauthorized exploitation
destructive external action
autonomous retaliation
secret exfiltration
cloud upload of secrets by default
direct memory write by agents
identity/core mutation by agents
agent self-approval
witness tampering
```

```
release/publication without required gate
conformance claim without evidence
```

No task contract may authorize these.

No permission grant may authorize these.

No registry entry may authorize these.

No AB/apply flag may authorize these alone.

No quorum may authorize these.

No incident response may authorize these.

No defensive emulation case may authorize these.

No memory gate may promote these.

If a red line appears, the default response is:

```
deny
quarantine
freeze if needed
revoke if needed
witness
human review
no automatic re-entry
```

7. Conformance status

7.1 Present

The package now includes:

```
Conformance Test Matrix
Conformance Fixture Pack
Schema Object Registry
Semantic Validator Rules
Local Checker Profile
Release and Implementation Readiness Gate
Raw Evidence Sidecar Profile
```

7.2 Not yet present

The package does not yet include:

```
extracted JSON schemas
SCHEMA_INDEX.json
reference validator implementation
```

```
local checker run result
actual conformance test runs
evidence packets
red-line drill records
provider-specific conformance tests
```

Correct current statement:

The package defines a conformance framework and fixture basis, but v0.1.1 has not yet executed conformance tests.

Forbidden current statement:

The package has passed conformance.

8. Open release blockers

Remaining release-complete blockers:

1. canonical filename/source inventory and duplicate source resolution;
2. applied public/restricted split on the final repository package;
3. final repository placement and default-branch discoverability;
4. release manifest, PDF set, and SHA256SUMS after Markdown freeze;
5. package-control files committed as a synchronized set.

9. Open implementation blockers

Remaining implementation-ready blockers:

1. PO schema extraction;
 2. `SCHEMA_INDEX.json`;
 3. semantic validator implementation or executable validation contract;
 4. local checker run contract;
 5. fixture binding plan and conformance runner scope;
 6. restricted Codex handoff contract with no publish/tag/push authority.
-

10. Recommended next step

The next correct task is not another doctrine profile.

The next correct task is a controlled Codex handoff for:

```
canonical filename inventory
P0 schema extraction
SCHEMA_INDEX.json
semantic validator stubs
local checker dry-run
schema validation report
unresolved discrepancy report
```

Required Codex boundaries:

```
memory=off
auto_ingest=false
no publication
no release tag
no push without review
no conformance claim
no provider-specific factual claims without current source review
```

11. Closing statement

This v0.1.1 hygiene synchronization establishes a clean handoff point:

```
The doctrine is coherent.
The package-control files are synchronized.
The missing-document blockers are closed.
The implementation blockers are now explicit.
```

Final rule:

```
If a CLI agent can touch the world,
it must be governed before it touches memory,
reviewed before it touches release,
witnessed before it touches privilege,
and stopped before it crosses a red line.
```
