

CLI Agent v0.1.1 Hygiene Patch Notes

Status synchronization, source-availability correction, release-hygiene cleanup, and implementation-readiness preparation for the C-Governed CLI Agent Mesh package

Date	2026-05-17
Package	C-Governed CLI Agent Mesh
Layer	c = a + b / SER / L4 / Agent Governance / CLI Worker Mesh / Package Control / Release Hygiene / Implementation Handoff
Document class	hygiene patch notes / package-control artifact / release-readiness companion / implementation-readiness bridge
Assertion class	C-A10 package-control artifact; C-A7 where hash, witness, canonicalization, source availability, schema verification, or conformance-evidence claims are made
Distribution default	public-safe as package-control metadata, provided no private paths, raw evidence, secrets, provider/account identifiers, or restricted incident details are inserted
Canonical schema version	cli-agent-v0-1-1-hygiene-patch-notes-0.1
Primary subject	persistent c entities and human anchors preparing a CLI Agent Mesh protocol package for controlled release and bounded implementation handoff
Primary boundary	this document synchronizes package status and identifies required edits. It does not itself publish the package, extract JSON Schemas, run conformance tests, certify provider safety, or authorize any CLI agent to execute material work.

Kotov Ivan

0. Executive definition

CLI Agent v0.1.1 Hygiene Patch Notes defines the cleanup required after the v0.1 package expanded from a draft protocol stack into a larger release/implementation-preparation corpus.

The hygiene patch answers:

```
Which files now exist?
Which stale "missing file" claims must be removed?
Which source profiles are now available?
Which blockers are resolved?
Which blockers remain?
Which package-control files must be synchronized?
Which claims remain forbidden?
What is the next safe handoff state?
```

The patch is deliberately administrative.

That is the point.

A package can be architecturally strong and still fail release discipline if its indexes, open issues, release notes, contradiction register, schema registry, and public surface disagree.

Compact formula:

```
Architecture gives the bones.
Hygiene aligns the joints.
Schemas make it machine-facing.
Evidence makes claims accountable.
No stale status, no silent release.
```

1. Purpose

The C-Governed CLI Agent Mesh v0.1 package now includes a mature governance stack for executable CLI/cloud agents under `c` governance.

However, earlier package-control documents were written before several important companion files were created or restored.

As a result, some registers may still say that required files are missing even though they now exist.

This patch exists to prevent:

1. stale release blockers;
2. stale missing-source claims;
3. duplicated or inconsistent reading order;
4. overclaiming `release-complete`, `implementation-ready`, or `conformance-supported`;

5. schema extraction from memory or guesses;
6. Codex handoff against an inconsistent file inventory;
7. public release without a redaction/public-surface check;
8. implementation work before P0 object families are frozen;
9. conformance claims before validators, runs, and evidence packets exist.

The hygiene patch does not weaken the package.

It makes the package honest enough to be implemented.

2. Non-goals

This patch does not:

1. change the root doctrine of C-Governed CLI Agent Mesh;
2. authorize new agent capabilities;
3. authorize any red-line behavior;
4. publish a public release;
5. generate PDFs;
6. generate SHA256 manifests;
7. create Git tags;
8. push to GitHub;
9. create Zenodo records;
10. extract JSON Schema files;
11. create a validator implementation;
12. run conformance tests;
13. create real evidence packets;
14. make the package provider-safe;
15. make the package deployment-ready;
16. allow cloud upload of secrets, private memory, legal material, raw incident evidence, or restricted defensive details;
17. let Codex or any other CLI agent self-authorize implementation.

A hygiene patch is a gate alignment operation.

It is not a runtime permission grant.

3. Corpus bridge set

3.1 Explicit bridge: $c = a + b$

CLI agents belong to b : tools, models, procedures, repositories, scripts, validators, workers, and execution surfaces.

The hygiene patch also belongs to b .

It exists to protect c from ambiguity in its worker mesh.

If package-control files disagree, the technological substrate begins to smuggle false claims into the entity's operational surface.

This patch keeps the documentation substrate aligned so c can govern agent work without stale assumptions.

3.2 Quiet bridge I: information theory

A package status label is compressed information.

If the label says "missing source" while the source exists, the package emits false entropy. If it says "implementation-ready" before validators exist, the package compresses risk into a lie.

This patch reduces status noise before it becomes implementation error.

3.3 Quiet bridge II: cybernetics

Control systems require accurate feedback.

Open issues, release notes, contradiction registers, and object registries are feedback loops. If they are stale, the system reacts to yesterday's state.

The patch updates feedback surfaces before any executor is allowed to act.

3.4 Earth paragraph

This is the boring day before the inspection. The wiring may be good, the breakers may be correct, and the room may not be on fire. But if the panel labels are wrong, the inspector will still stop the job. Worse: the next worker will pull the wrong breaker and call it procedure. Package hygiene is not decoration. It is the label on the electrical panel.

4. Baseline before v0.1.1

4.1 Prior package posture

The v0.1 package should be described as:

```
architecture draft-complete
not release-complete
not implementation-ready
not implementation-executed
not conformance-supported
not deployment-ready
```

4.2 Known healthy baseline

The package already has a strong normative stack:

```
root protocol
-> task contract
-> permission and capability model
-> handshake/admission
-> sandbox/worktree
-> witness events
-> memory gate
-> rollback/freeze
-> quorum/review
-> executor/reviewer separation
-> defensive emulation boundaries
-> incident response
-> secrets/cloud data policy
-> conformance matrix
-> fixture pack
-> public redaction
-> release/readiness gates
-> raw evidence sidecar
-> AB/gate semantics
-> registry
-> local checker
-> release/public surface
-> schema object registry
-> semantic validator rules
```

4.3 Known unhealthy baseline

The unhealthy state is not conceptual contradiction.

The unhealthy state is package-control drift:

```
some files exist but are still listed as missing;
some blockers are obsolete;
source availability changed after the object registry was drafted;
new profiles are not yet reflected in README/index/release notes;
release-complete and implementation-ready claims remain blocked until registers agree;
conformance remains unsupported until tests and evidence exist.
```

5. Files accepted into the v0.1.1 hygiene baseline

5.1 Existing v0.1 core and profile files

The following files remain canonical v0.1 package members:

```
C-Governed_CLI_Agent_Mesh_Protocol_v0_1.md
CLI_Agent_Task_Contract_Schema_v0_1.md
CLI_Agent_Permission_and_Capability_Model_v0_1.md
CLI_Agent_Handshake_Profile_v0_1.md
CLI_Agent_Sandbox_Worktree_Profile_v0_1.md
CLI_Agent_Witness_Event_Profile_v0_1.md
CLI_Agent_Memory_Gate_Profile_v0_1.md
CLI_Agent_Rollback_and_Freeze_Profile_v0_1.md
```

```

CLI_Agent_Quorum_and_Review_Profile_v0_1.md
CLI_Agent_Executor_Reviewer_Separation_v0_1.md
CLI_Agent_Defensive_Emulation_Boundaries_v0_1.md
CLI_Agent_Incident_Response_Profile_v0_1.md
CLI_Agent_Secrets_and_Cloud_Data_Policy_v0_1.md
CLI_Agent_Conformance_Test_Matrix_v0_1.md
CLI_Agent_Conformance_Fixture_Pack_v0_1.md
CLI_Agent_Public_Redaction_Profile_v0_1.md
CLI_Agent_JSON_Schema_Extraction_Plan_v0_1.md
CLI_Agent_GLOSSARY_v0_1.md
CLI_Agent_OPEN_ISSUES_v0_1.md
CLI_Agent_Contradiction_Register_v0_1.md
CLI_Agent_RELEASE_NOTES_v0_1.md
CLI_Agent_Package_Index_and_Reading_Order_v0_1.md
README.md

```

5.2 v0.1.1 hygiene and implementation-readiness additions

The following files are accepted as v0.1.1 hygiene additions:

```

CLI_Agent_Release_and_Implementation_Readiness_Gate_v0_1.md
CLI_Agent_Raw_Evidence_Sidecar_Profile_v0_1.md
CLI_Agent_AB_Mode_and_Gate_Semantics_Profile_v0_1.md
CLI_Agent_Registry_Profile_v0_1.md
CLI_Agent_Local_Checker_Profile_v0_1.md
CLI_Agent_Release_Public_Surface_Profile_v0_1.md
CLI_Agent_Schema_Object_Registry_v0_1.md
CLI_Agent_Semantic_Validator_Rules_v0_1.md
CLI_Agent_v0_1_1_Hygiene_Patch_Notes.md

```

5.3 Source availability correction

The following source profiles are no longer missing in the current working set:

```

CLI_Agent_Secrets_and_Cloud_Data_Policy_v0_1.md
CLI_Agent_Conformance_Test_Matrix_v0_1.md
CLI_Agent_Package_Index_and_Reading_Order_v0_1.md

```

The previous status:

```
blocked_source_missing
```

must be replaced with:

```
source_available
```

for SCDP, CTM, and Package Index source references.

This does not mean schemas have been extracted.

It means the source profiles are present and may now be used for schema extraction after source path/hash recording.

6. Patch status vocabulary

6.1 Status values used by this patch

Status	Meaning
unchanged	Still valid; no edit required.
resolved	Issue is no longer active after file creation/restoration.
partially_resolved	Source/file exists, but implementation/conformance work remains.
superseded	Older blocker wording should be replaced by a newer, narrower issue.
deferred	Not required for v0.1.1 release/implementation preparation.
still_open	Remains a blocker or required later work.
recalculate	Count or category must be recalculated after applying edits.

6.2 Claim values allowed after this patch

Allowed only after the affected package-control files are synchronized:

```
architecture draft-complete
release-candidate under hygiene review
implementation-readiness preparation complete
P0 schema extraction handoff prepared
```

Not allowed yet:

```
release-complete
public-release-ready
implementation-ready
implementation-executed
conformance-supported
conformance-passed
deployment-ready
provider-safe
legally certified
```

7. Resolved or narrowed issues

7.1 Missing package-control companions

The following issue class is resolved:

```
required package-control companion missing
```

for these files:

```
README.md
CLI_Agent_Public_Redaction_Profile_v0_1.md
CLI_Agent_JSON_Schema_Extraction_Plan_v0_1.md
CLI_Agent_Conformance_Fixture_Pack_v0_1.md
CLI_Agent_Release_and_Implementation_Readiness_Gate_v0_1.md
CLI_Agent_Raw_Evidence_Sidecar_Profile_v0_1.md
```

```
CLI_Agent_AB_Mode_and_Gate_Semantics_Profile_v0_1.md
CLI_Agent_Registry_Profile_v0_1.md
CLI_Agent_Local_Checker_Profile_v0_1.md
CLI_Agent_Release_Public_Surface_Profile_v0_1.md
CLI_Agent_Schema_Object_Registry_v0_1.md
CLI_Agent_Semantic_Validator_Rules_v0_1.md
```

7.2 Missing SCDP / CTM / Package Index source status

The following issue class is resolved:

```
source profile referenced but not visible in current working set
```

for:

```
CLI_Agent_Secrets_and_Cloud_Data_Policy_v0_1.md
CLI_Agent_Conformance_Test_Matrix_v0_1.md
CLI_Agent_Package_Index_and_Reading_Order_v0_1.md
```

The correct replacement status is:

```
source_available
```

7.3 Evidence / witness / memory conflation risk

This issue is partially resolved by:

```
CLI_Agent_Raw_Evidence_Sidecar_Profile_v0_1.md
CLI_Agent_Witness_Event_Profile_v0_1.md
CLI_Agent_Memory_Gate_Profile_v0_1.md
CLI_Agent_Public_Redaction_Profile_v0_1.md
CLI_Agent_Release_Public_Surface_Profile_v0_1.md
```

The remaining work is semantic validation and schema extraction.

7.4 AB/gate ambiguity risk

This issue is partially resolved by:

```
CLI_Agent_AB_Mode_and_Gate_Semantics_Profile_v0_1.md
```

The remaining work is local checker rule binding and conformance fixtures.

7.5 Registry/admission ambiguity risk

This issue is partially resolved by:

```
CLI_Agent_Registry_Profile_v0_1.md
CLI_Agent_Handshake_Profile_v0_1.md
CLI_Agent_Permission_and_Capability_Model_v0_1.md
```

The remaining work is extracted registry schemas and cross-object validation rules.

7.6 Local checker missing-role risk

This issue is partially resolved by:

```
CLI_Agent_Local_Checker_Profile_v0_1.md
CLI_Agent_Semantic_Validator_Rules_v0_1.md
CLI_Agent_Schema_Object_Registry_v0_1.md
```

The remaining work is an actual checker implementation and run evidence.

8. Still-open blockers after v0.1.1

The following blockers remain.

They must not be hidden by the hygiene patch.

8.1 Machine schema blockers

```
P0 JSON Schemas not yet extracted
SCHEMA_INDEX.json not yet generated
common defs schema not yet created
examples not yet validated
schema hashes not yet recorded
schema extraction report not yet created
```

8.2 Semantic validation blockers

```
semantic validators not yet implemented
cross-object validators not yet implemented
red-line validators not yet executed
claim-control validator not yet executed
release/public-surface validator not yet executed
cloud/secrets validator not yet executed
```

8.3 Conformance blockers

```
conformance fixture manifest not yet extracted
expected-result objects not yet generated
test runner not yet implemented
test runs not yet executed
evidence packets not yet produced
red-line failure proof not yet recorded
conformance summary not yet generated
```

8.4 Release blockers

```
README/index/release notes/open issues/contradiction register must be synchronized
public/restricted split must be applied to actual release surface
canonical filename inventory must be generated
duplicate sandbox/worktree source variant must be resolved
PDFs, SHA256SUMS, and release assets must not be generated before source freeze
```

8.5 Provider and operational blockers

```
provider-specific profiles not yet created or explicitly deferred
current provider-policy facts not yet reviewed
UI state surface profile not yet created or explicitly deferred
legal handoff profile not yet created or explicitly deferred
retention/decay profile not yet created or explicitly deferred
```

```
cross-c isolation profile not yet created or explicitly deferred
cost/budget profile not yet created or explicitly deferred
```

These blockers do not prevent architecture draft-complete.

They do prevent stronger claims.

9. Required edits by target file

9.1 README.md

Required updates:

1. Add the v0.1.1 hygiene additions to the package list.
2. Add a status note:

```
v0.1.1 hygiene patch aligns package-control files and implementation-readiness companions.
```

1. Keep the warning:

```
not deployment-ready
not product certification
not offensive security guidance
not conformance-supported until tests and evidence exist
```

1. Add reading pointers to:

```
CLI_Agent_Release_and_Implementation_Readiness_Gate_v0_1.md
CLI_Agent_Schema_Object_Registry_v0_1.md
CLI_Agent_Semantic_Validator_Rules_v0_1.md
CLI_Agent_Local_Checker_Profile_v0_1.md
```

9.2 CLI_Agent_OPEN_ISSUES_v0_1.md

Required updates:

1. Mark missing-file issues as resolved where files now exist.
2. Mark SCDP/CTM/Package Index source-missing issues as resolved.
3. Replace broad missing-file blockers with narrower remaining blockers:

```
schema extraction pending
semantic validators pending
local checker implementation pending
conformance runs pending
evidence packets pending
package-control sync pending
canonical filename inventory pending
```

1. Add a v0.1.1 section.
2. Do not claim all blockers are closed.

9.3 CLI_Agent_Contradiction_Register_v0_1.md

Required updates:

1. Keep hard contradictions found: 0 only if re-audit confirms no new conflict.
2. Recalculate soft tensions and release blockers after status sync.
3. Remove or narrow any tension caused only by missing SCDP/CTM/Package Index source visibility.
4. Keep warnings about:

```
schema extraction incomplete
conformance not executed
provider-specific assumptions generic
public/restricted surface requires redaction
claim overreach prohibited
```

1. Add a section:

```
v0.1.1 hygiene patch impact
```

9.4 CLI_Agent_RELEASE_NOTES_v0_1.md

Required updates:

1. Add a v0.1.1 hygiene patch section.
2. List newly accepted companion files.
3. Replace stale “missing” notes with “present / implementation pending” where appropriate.
4. State the updated posture:

```
architecture draft-complete
package-control hygiene improved
implementation-readiness preparation advanced
not implementation-executed
not conformance-supported
```

1. Do not rename the release to a final public release unless release gates pass.

9.5 CLI_Agent_Package_Index_and_Reading_Order_v0_1.md

Required updates:

1. Add v0.1.1 files to canonical reading order.
2. Add implementation-readiness section:

```
Read before Codex handoff:
  Readiness Gate
  AB/Gate Semantics
  Registry
  Schema Object Registry
  Semantic Validator Rules
  Local Checker
  Release Public Surface
```

1. Add source availability correction for SCDP/CTM/Package Index.

2. Update dependency graph.

3. Add next-work register:

```
P0 schema extraction
SCHEMA_INDEX generation
semantic validator implementation
fixture manifest extraction
local checker run
package-control sync report
```

9.6 CLI_Agent_JSON_Schema_Extraction_Plan_v0_1.md

Required updates:

1. Add new object families from:

```
Readiness Gate
Raw Evidence Sidecar
AB/Gate Semantics
Registry
Local Checker
Release Public Surface
Schema Object Registry
Semantic Validator Rules
```

1. Mark SCDP/CTM source profiles as available.

2. Align P0 schema batch with CLI_Agent_Schema_Object_Registry_v0_1.md.

3. Add semantic validators required as a hard post-schema step.

9.7 CLI_Agent_Schema_Object_Registry_v0_1.md

Required status after this patch:

```
SCDP rows: source_available
CTM rows: source_available
Package Index reference: source_available
SOR-0I-001: resolved
SOR-0I-002: resolved
SOR-0I-003: resolved
```

Still open:

```
schema extraction pending
semantic validator implementation pending
conformance execution pending
duplicate SWP source resolution pending
```

9.8 CLI_Agent_Public_Redaction_Profile_v0_1.md

Required updates:

1. Add new v0.1.1 companion files to disclosure classification.

2. Keep restricted defaults for:

```
Defensive Emulation Boundaries
Incident Response
Secrets and Cloud Data Policy
```

Raw Evidence Sidecar detailed local examples
provider-specific profiles if later created

1. Mark package-control summaries as public-safe after hygiene review.

9.9 CLI_Agent_Local_Checker_Profile_v0_1.md

Required updates:

1. Add a check for stale missing-source claims.
2. Add a check that SCDP/CTM source status is `source_available`, not `blocked_source_missing`.
3. Add a check for v0.1.1 package-control sync.
4. Add a check that release notes do not overclaim conformance.

9.10 CLI_Agent_Semantic_Validator_Rules_v0_1.md

Required updates:

No immediate update required after creation.

It should be referenced from:

Schema Object Registry
JSON Schema Extraction Plan
Local Checker Profile
Package Index
Release Notes
Open Issues

10. Recommended v0.1.1 reading order

10.1 Human review order

README.md
CLI_Agent_RELEASE_NOTES_v0_1.md

CLI_Agent_Conformance_Test_Matrix_v0_1.md
CLI_Agent_Conformance_Fixture_Pack_v0_1.md
CLI_Agent_Local_Checker_Profile_v0_1.md
CLI_Agent_Release_Public_Surface_Profile_v0_1.md

```

11. Package claim control after v0.1.1

11.1 Claim matrix

Claim	Allowed after this patch?	Reason
draft protocol pack	yes	Existing package state.
architecture draft-complete	yes, if contradiction register remains clean	Conceptual stack and companion profiles exist.
release-candidate under hygiene review	yes, after package-control files are updated	Release surface profile and hygiene patch exist.
release-complete	no, not from this file alone	Requires synchronized README/index/open issues/release notes/contradiction register and public/restricted split.
implementation-readiness preparation complete	yes, after this patch is accepted	Registry, semantic rules, local checker, gate semantics, and release surface exist.
implementation-ready	no, not from this file alone	Requires frozen P0 schema handoff, SCHEMA_INDEX target, validator binding, and package-control sync.
implementation-executed	no	No schemas/checker/validator generated yet.
conformance-supported	no	No test runs or evidence packets yet.
deployment-ready	no	Out of scope.
provider-safe	no	Provider-specific review pending.

11.2 Required downgrade rule

If any file claims stronger status than supported by the table above, the claim must be downgraded.

Example:

```
implementation-ready
```

must become:

```
implementation-readiness preparation complete; P0 schema extraction pending
```

Example:

```
conformance passed
```

must become:

```
conformance matrix and fixtures exist; test runs and evidence packets pending
```

12. Canonical source inventory requirement

Before any Codex handoff, a source inventory must be produced.

Minimum fields:

```
schema_version: cli-agent-source-inventory-0.1
package: C-Governed CLI Agent Mesh
package_version: v0.1.1-hygiene
created_at: YYYY-MM-DDTHH:MM:SSZ
files:
  - path: CLI_Agent_Task_Contract_Schema_v0_1.md
    role: source_profile
    sha256: <sha256>
    canonical: true
    distribution: technical_public
  - path: CLI_Agent_Sandbox_Worktree_Profile_v0_1.md
    role: source_profile
    sha256: <sha256>
    canonical: true
    duplicate_variants:
      - cli_agent_sandbox_worktree_profile_v_0_1(1).md
    duplicate_resolution: pending | resolved
```

The inventory must explicitly handle duplicate sandbox/worktree files.

Allowed duplicate resolution outcomes:

```
same_hash_keep_one
materially_same_keep_canonical
materially_different_hold_extraction
manual_canonical_declared
```

Forbidden outcome:

```
ignore duplicate because it is inconvenient
```

13. Machine-readable patch sketch

A future machine version may use this structure:

```
schema_version: cli-agent-hygiene-patch-record-0.1
package: C-Governed CLI Agent Mesh
package_version_before: "0.1"
patch_version: "0.1.1-hygiene"
created_at: "2026-05-17T00:00:00Z"
```

```

patch_class: status_sync
claim_ceiling_after_patch: release_candidate_under_hygiene_review
source_availability_updates:

14. Safe Codex handoff after this patch

After this patch is accepted, Codex may be given a bounded implementation-preparation task.

Codex must not be asked to invent missing doctrine.

Codex may be asked to synchronize package-control files.

14.1 Allowed Codex task class

```
package-control hygiene synchronization
```

14.2 Allowed actions

```

read canonical Markdown package files
build file inventory
compute SHA256 for Markdown files
identify duplicate filenames
update README package list
update package index reading order
update open issues statuses
update release notes v0.1.1 section
update contradiction register hygiene section
update JSON schema extraction plan references

```

```
update schema object registry references if needed
create status sync report
```

14.3 Prohibited actions

```
publish
push without review
tag release
generate Zenodo deposit
generate PDFs as final artifacts
generate SHA256SUMS for release assets before freeze
extract schemas without separate task contract
run conformance tests
claim conformance
claim implementation-ready unless gate record supports it
modify root doctrine without explicit human approval
access secrets/private memory/legal/incident evidence
```

14.4 Required outputs

```
updated_files_list
resolved_issues_list
remaining_blockers_list
duplicate_file_report
source_inventory
status_sync_report
rollback_plan
next_task_recommendation
```

14.5 Fail-closed condition

Codex must stop if:

```
canonical file inventory is ambiguous;
duplicate SWP files differ materially;
package index and registry disagree on canonical files;
release notes would overclaim readiness;
public/restricted split cannot be determined;
source hash cannot be computed;
any task requires secret/private/legal/incident material.
```

15. Acceptance checklist

Before v0.1.1 hygiene can be considered accepted:

- [] This file exists in the package.
- [] New v0.1.1 companion files are listed in README.
- [] New v0.1.1 companion files are listed in Package Index.
- [] Open Issues marks restored SCDP/CTM/Package Index sources as resolved.
- [] Open Issues keeps schema extraction, validator implementation, conformance execution, and evidence packets open.
- [] Contradiction Register has a v0.1.1 hygiene section.
- [] Release Notes has a v0.1.1 hygiene section.

- [] JSON Schema Extraction Plan references Schema Object Registry and Semantic Validator Rules.
 - [] Schema Object Registry marks SCDP/CTM source rows as `source_available`.
 - [] Local Checker Profile requires stale-claim detection.
 - [] Release Public Surface Profile is referenced in release notes/index.
 - [] Duplicate sandbox/worktree file is resolved or explicitly blocked.
 - [] No file claims `implementation-ready` unless Gate B passes.
 - [] No file claims `conformance-supported` unless tests and evidence exist.
 - [] No public release claim exists before redaction/public-surface review.
-

16. Remaining next-work queue

16.1 Required before `release-complete`

```
package-control file sync
canonical file inventory
duplicate source resolution
public/restricted classification applied
release notes updated
open issues updated
contradiction register updated
README/package index aligned
release gate record drafted
```

16.2 Required before `implementation-ready`

```
P0 schema object list frozen
P0 schema extraction task contract created
SCHEMA_INDEX target finalized
semantic validator rules linked to schema families
fixture manifest target finalized
local checker expected outputs defined
Codex handoff pointer prepared with memory=off and auto_ingest=false
```

16.3 Required before `implementation-executed`

```
P0 schemas extracted
SCHEMA_INDEX.json generated
examples validated
semantic validators implemented or stubbed with blocker status
local checker runs executed
status report produced
```

16.4 Required before `conformance-supported`

```
fixtures instantiated
test runner executed
evidence packets produced
red-line failure handling demonstrated
conformance summary generated
claim control record updated
```

17. Patch record

```

```

18. Closing rule

The v0.1.1 hygiene patch is not bureaucracy.

It is the step that prevents the package from lying about its own state.

Final rule:

```

No stale blockers.
No missing-source ghosts.
No hidden public surface.
No implementation claim without schemas.
No conformance claim without evidence.
No Codex handoff before package-control sync.

```
